

# Code Layout, Readability and Reusability

## Code Layout, Readability and Reusability

### Project Layout

The development phase separates responsibilities into:

- app.py — FastAPI application and routes.
- auth.py — password hashing, authentication and tokens.
- gemini\_utils.py — AI integration, prompts, JSON parsing and links.
- models.py — Pydantic data models.
- templates/ — HTML pages.
- static/styles.css — shared styling.
- requirements.txt — dependencies.

### Readability and Reusability

- Keep responsibilities separated so each file has one job.
- Reuse planner helpers for JSON parsing and shopping-link creation.
- Use shared templates and CSS for a consistent interface.
- Validate inputs through Pydantic models.
- Keep authentication logic separate from route logic.
