

Performance Testing

Performance Testing

Current Status

Performance/load testing is not implemented in this version of PocketSmart AI.

The project test plan explicitly lists load and performance testing under "Not tested in this version."

What Can Be Tested Later

- Response time for each planner.
- Concurrent users.
- Gemini API latency.
- Large input handling.
- Image-upload processing time.
- Memory usage during long-running sessions.

Important Limitation

The current application stores users, tokens and history in memory, so restarting the server clears that state. Performance results should be recorded only after actual tests are run.
